

Activity 5 Names: _____

Answers should be filled in on this sheet except where noted.

1. Pick up an acrylic frame, 6 hooks, and 3 rubber bands from the front of the room.
2. Find an object that can be used as a mass (25 grams is about the minimum).
3. Measure the mass of the object and convert it to a force, W .

Object weight: $W = \underline{\hspace{2cm}} \text{N}$

4. Suspend the mass from three holes on the frame using the three rubber bands.
5. Using a ruler, measure the x , y and z distances from one end of the rubber band to the other.

For the first rubber band: $\delta_{x,1} = \underline{\hspace{2cm}} \text{mm}$

$\delta_{y,1} = \underline{\hspace{2cm}} \text{mm}$

$\delta_{z,1} = \underline{\hspace{2cm}} \text{mm}$

For the second rubber band: $\delta_{x,2} = \underline{\hspace{2cm}} \text{mm}$

$\delta_{y,2} = \underline{\hspace{2cm}} \text{mm}$

$\delta_{z,2} = \underline{\hspace{2cm}} \text{mm}$

For the third rubber band: $\delta_{x,3} = \underline{\hspace{2cm}} \text{mm}$

$\delta_{y,3} = \underline{\hspace{2cm}} \text{mm}$

$\delta_{z,3} = \underline{\hspace{2cm}} \text{mm}$

6. Using the weight from step 3 and the measurements from step 5, calculate the force in each applied to each rubber band assuming particle equilibrium. Show your work on a separate sheet.

For the first rubber band: $\dot{F}_1 = \underline{\hspace{2cm}} \text{N}$

For the second rubber band: $\dot{F}_2 = \underline{\hspace{2cm}} \text{N}$

For the third rubber band: $\dot{F}_3 = \underline{\hspace{2cm}} \text{N}$

7. Measure the length of each rubber band and use it to calculate the force in each rubber band using the provided calibration.

For the first rubber band: $L_1 = \underline{\hspace{2cm}}$ mm

$F_1 = \underline{\hspace{2cm}}$ N

For the second rubber band: $L_2 = \underline{\hspace{2cm}}$ mm

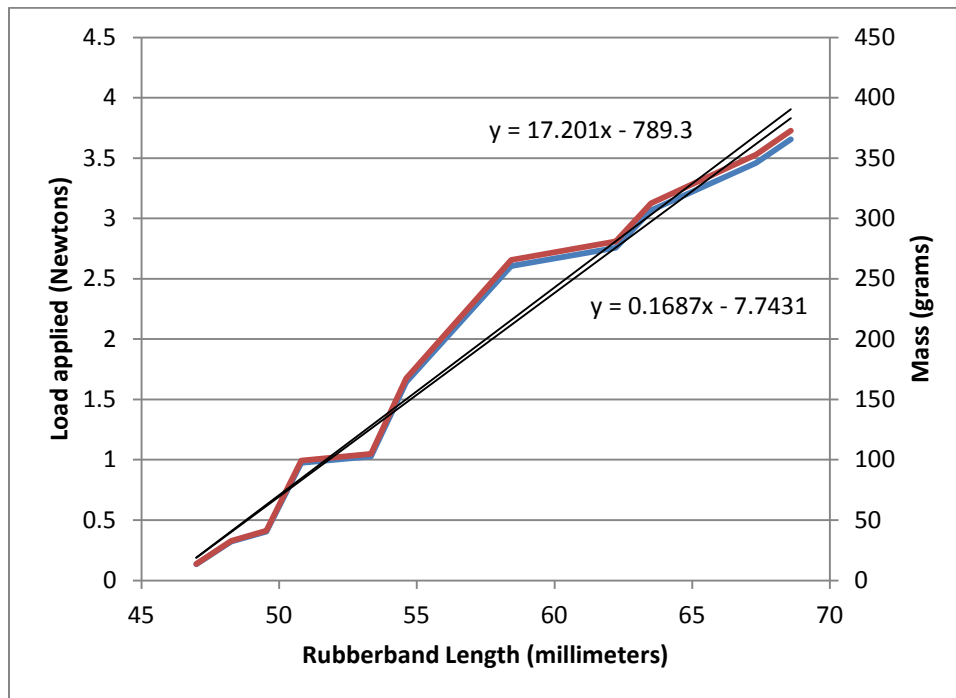

$F_2 = \underline{\hspace{2cm}}$ N

For the third rubber band: $L_3 = \underline{\hspace{2cm}}$ mm

$F_3 = \underline{\hspace{2cm}}$ N

8. Calculate the performance metric, $m = \sqrt{(F_1 - \dot{F}_1)^2 + (F_2 - \dot{F}_2)^2 + (F_3 - \dot{F}_3)^2} / W$

$m = \underline{\hspace{2cm}}$

Load in Newtons: $F = 0.1687 * \text{Length}(\text{mm}) - 7.7431$
